

Artifact 3 Question Redesign

*CU Dialogues Portfolio - Spring 2025
Ghizlane Rehioui*

Original Question:

Will AI replace your job soon?

Redesign #1:

How can we make AI more reliant on people than the other way around?

Redesign #2:

If AI replaces enough jobs should we change the shape of our economy to accommodate?

Pushback:

Yes, because AI can be trained on anything and soon enough, newer more complex algorithms will be more efficient and faster in providing the same exact output/product you are providing the employer. Examples of that are copywriting, coding and debugging which are now easier to do using AI, or even tasks that were completely taken over by AI.

Response:

If efficiency becomes the only value we optimize for, what might we lose in terms of creativity, ethics, or human connection? How do we define the “value” of human labor beyond speed and accuracy?

Running notes from share out:

- What does it really mean for AI to “replace” a human? Is it about full replacement or task redistribution?
- AI could be used to complete mundane and repetitive tasks more efficiently, allowing humans to focus on more meaningful or creative work.
- Concerns were raised about how AI is trained: who provides the data, and what are the implications for privacy and data security?
- The assumed accuracy of AI systems should be questioned and discussed ways to address their potential for error.
- Even if AI becomes highly capable, are humans still essential to oversee, interpret, or ethically guide its use?
