21 **Short Running Title:** *(45 letters and spaces)* Hospital Response to Hurricane Harvey

22  
23 **Sources of Support:** Financial assistance was provided by the University of Colorado Boulder's  
24 Department of Geography, the United Government of Graduate Students (UGGS) at the  
25 University of Colorado Boulder, and the Center to Advance Research and Teaching in the Social  
26 Sciences (CARTSS) at the University of Colorado Boulder.

27

28 **Hospital Preparedness, Mitigation, and Response to Hurricane Harvey in Harris County,**  
29 **Texas**  
30

31 **Structured Abstract**

32 **Objective:** This case study documents Harris County hospitals' flood preparedness and  
33 mitigation efforts prior to Hurricane Harvey, their collective response experience during  
34 Hurricane Harvey, and their lessons learned in the storm's aftermath.

35 **Methods:** The case study was constructed using a survey of hospital emergency managers, semi-  
36 structured interviews with local agencies involved in public health, emergency management, and  
37 healthcare, and an analysis of news reports and other documents from a variety of government  
38 agencies, local organizations, and hospitals themselves.

39 **Results:** Harris County hospitals learned their most valuable lessons through their direct and  
40 repeated experience with flooding over the years, leading to improved preparedness prior to  
41 Hurricane Harvey. Hospital emergency response successes included infrastructure  
42 improvements, staff resilience, advanced planning, and pre-established collaboration. However,  
43 hospitals still experienced challenges with staff burnout, roadway flooding, and patient  
44 evacuation.

45 **Conclusions:** Although the current state of hospital flood preparedness and mitigation is rather  
46 advanced and mature, it is advisable that Harris County takes steps to strengthen emergency  
47 management efforts in hospitals with fewer financial and staffing resources and less direct flood  
48 experience.

54 This study was deemed “exempt” by the University of Colorado Boulder Institutional Review  
55 Board.

56

57 **INTRODUCTION**

58 In August 2017, Hurricane Harvey made landfall as a Category 4 hurricane on the Texas  
59 coast, with its record-breaking rainfall flooding at least 25% of Harris County.<sup>1</sup> Preliminary  
60 reports revealed many hospitals in Harris County struggled with building flooding and damage,  
61 patient evacuation, and road access.<sup>2</sup> During extreme flooding events, hospitals are tasked with  
62 providing both routine and emergency healthcare services, often at surge capacity. Hurricane  
63 Harvey provided an opportunity to explore Harris County hospitals’ successes and challenges  
64 during an extreme flooding event and to evaluate their current state of flood preparedness and  
65 mitigation. Given extreme flooding events are projected to increase in frequency and intensity  
66 across the U.S. over the next decade,<sup>3</sup> it is crucial to consider local case studies to better  
67 understand the full range of hospital flooding impacts, and to evaluate strategies to reduce future  
68 vulnerabilities.

69 This case study constructs a narrative detailing Harris County hospitals' flood  
70 preparedness and mitigation efforts prior to Hurricane Harvey, their collective experience during  
71 Hurricane Harvey, and their lessons learned in the storm’s aftermath. This case study was  
72 constructed using surveys of hospital emergency managers, semi-structured interviews with local  
73 agencies involved in public health, emergency management, and healthcare, and an analysis of  
74 news reports and other documents from a variety of government agencies, local organizations,

75 and hospitals. Through the synthesis of data on hospitals across Harris County, this case study  
76 evaluates hospitals' emergency responses to Hurricane Harvey and creates an argument for  
77 adopting additional flood preparedness and mitigation measures in hospitals to prepare for future  
78 flooding events in coastal Texas and elsewhere.

79

## 80 **METHODS**

81

### 82 **Survey and Interview Protocol**

83 To construct a case study of Harris County hospitals' preparedness, mitigation, and  
84 response to Hurricane Harvey, we first developed an online survey for hospital emergency  
85 managers. The qualitative survey was designed to be applicable to all 80 non-psychiatric,  
86 whether affected by Hurricane Harvey or not, and was intended to directly explore these  
87 hospitals' successes and challenges during an extreme flooding event and evaluate their state of  
88 flood preparedness and mitigation. Five categories of questions were included in the survey: 1)  
89 general information about the survey respondent and their hospital; and the hospitals' 2) past  
90 experience with flooding (i.e., prior to Hurricane Harvey); 3) experience with flooding from  
91 Hurricane Harvey; 4) current state of flood preparedness/mitigation; and 5) barriers to flood  
92 preparedness/mitigation. A survey expert reviewed and refined an initial draft of the survey. The  
93 survey was administered online through Google Forms from May-December 2018.

94 Secondly, a similar key informant interview protocol was developed for interviews with  
95 local agencies involved in public health, emergency management, and healthcare in Harris  
96 County. While the survey provided hospital-specific responses by each emergency manager, the  
97 interview protocol was designed to supplement the surveys by exploring the same themes on a

98 county-wide scale. Therefore, the interview questions were adapted from the survey questions,  
99 with modifications to better suit the local agency target population and allow for a semi-  
100 structured format and open-ended answers. For example, whereas the survey asked individual  
101 hospitals to comment on their historical experience with flooding, the interview protocol instead  
102 asked local agencies to comment on the combined historical experiences of hospitals with  
103 flooding across Harris County. The interviews were conducted in-person in August 2018, lasting  
104 approximately 45 minutes each. The interviews were transcribed verbatim from audio  
105 recordings.

106

### 107 **Participant Recruitment**

108 The 80 non-psychiatric hospitals in Harris County, Texas were established using  
109 Homeland Infrastructure Foundation-Level Data.<sup>4</sup> An effort was made to identify an emergency  
110 manager from all 80 hospitals using several methods, including repeated phone calls and emails  
111 with the hospitals, referrals, and Google and LinkedIn searches. The emergency managers  
112 identified were then contacted directly via email with an invitation to participate in the survey,  
113 including a consent form, details on the survey's purpose and length, and a compensation offer.  
114 In the case of non-response, two follow-up emails were sent. To improve access and trust with  
115 the target hospital emergency managers, the SouthEast Texas Regional Advisory Council  
116 (SETRAC) also attempted to increase response rates by disseminating the invitation to  
117 participate through their internal email list. Out of 80 hospitals in Harris County, three hospitals'  
118 emergency managers (4%) accepted and responded to the survey.

119 To explore the same themes on a county-wide scale, we additionally sought the  
120 perspective of local public health, emergency management, and healthcare agencies in Harris

121 County by conducting in-person interviews with key informants from several agencies. These  
122 local agencies were specifically selected for their trusted perspectives and comprehensive  
123 knowledge of both hospital experiences during Hurricane Harvey and hospital flood  
124 preparedness and mitigation efforts on a county-wide scale. The local agency representatives  
125 were identified via the agency's website, contacted directly via email, and provided with an  
126 invitation to participate in an interview, including a consent form, details on the interview's  
127 purpose and length, and a compensation offer. Out of five agencies contacted, four agencies  
128 (80%) accepted and were interviewed.

129 Individuals who responded to the survey or interview were aggregated with their  
130 respective hospitals or agencies, which were then de-identified to protect their identities (Table  
131 1). *Surveyed* hospitals are referred to with letters (e.g., Hospital A) and *interviewed* local  
132 agencies are referred to with numbers (e.g., Agency 1).

133

### 134 **Secondary Sources**

135 Lastly, in addition to the survey and key informant interviews, secondary data sources  
136 were incorporated into the analysis and provided crucial information about the experiences of  
137 Harris County hospitals for which we did not receive survey responses, and also serving to  
138 validate the key informant interview findings. These secondary sources were identified through a  
139 thorough scan of Google searches and vetted for reliability and rigor. Search keywords included  
140 hospital, Hurricane Harvey, flood, and inundation, paired with specific Harris County hospital  
141 names. The secondary sources are categorized as follows: news reports (n=31), peer-reviewed  
142 journal articles (n=1), documents from government agencies (n=2), documents from local  
143 agencies (n=3), and hospital websites (n=10).

144

## 145 **Combined Analysis of Survey, Interview, and Secondary Sources**

146 An inductive approach was used to organize and condense the survey, interview, and  
147 secondary source data into coherent key themes related to hospital preparedness, mitigation, and  
148 response to Hurricane Harvey. After many close readings of the survey and interview results and  
149 secondary data sources, several key themes emerged and are presented below with selected  
150 quotes from surveys and interviews presented to demonstrate each theme.

151

## 152 **RESULTS**

153

### 154 **Historical Experience with Flooding and Mitigation before Hurricane Harvey**

155 Most Harris County hospitals learned their most valuable lessons about flood mitigation  
156 from their historical experience with previous storms such as Tropical Storm Allison (2001), the  
157 Memorial Day Flood (2015) and the Tax Day Flood (2016). Although not directly impacted by  
158 Hurricanes Katrina and Sandy, Harris County’s hospitals were able to learn from the experiences  
159 of affected hospitals during those flooding events in New Orleans and New York, respectively.<sup>5</sup>  
160 These lessons led to the implementation of several flood mitigation efforts over the past decade  
161 across Harris County prior to Hurricane Harvey.

162

163 “I think the greatest impact on hospitals in our history has been Tropical Storm Allison.  
164 The entire Texas Medical Center (TMC) was impacted, which brought about great  
165 opportunities for flood mitigation and the Medical Center now has various flood  
166 protection devices installed, which include flood gates, flood walls, submarine doors. So

167 they've made a lot of capital improvements and infrastructure retrofits to protect their  
168 buildings and facilities.” - *Agency 3*

169  
170 Additionally, many hospitals within the TMC moved their first floor operations and  
171 utilities to higher floors, and planned for redundancy in their basic operating systems to ensure  
172 continuity of services during future flooding events.<sup>2</sup> After Tropical Storm Allison, the TMC  
173 also installed skywalk bridges between buildings, allowing for patient transportation above  
174 ground. Some skywalks were fitted with a protective film to provide wind resistance and hold  
175 broken glass in place. The TMC, with Rice University's assistance, developed the real-time  
176 Flood Alert System that combines radar, rain gage and flood stage data, and hydrologic modeling  
177 to forecast flooding and suggest when flood gates should be deployed.<sup>6</sup>

178 Not all hospitals in Harris County were able to implement sophisticated flood mitigation  
179 efforts after Tropical Storm Allison like the TMC. Some smaller hospitals had limited resources  
180 available, while others had little to no previous experience with flooding and lacked the seasoned  
181 perspective of those that have flooded repeatedly.

182

### 183 **Perceptions of Hospital Flood Risk before Hurricane Harvey**

184 Interviews with four local public health, emergency management, and healthcare  
185 agencies revealed there is no consensus on the exact number of Harris County hospitals located  
186 within FEMA flood hazard areas. One agency estimated likely more than half of Harris County's  
187 hospitals were at risk of flooding, based on the fact the county has a complex network of  
188 waterways with many flood hazard areas. However, the flood hazard areas are not perfect  
189 predictors of where flooding will occur.<sup>4</sup>

190

191 “One of the unique things about Harris County is that it has 22 watersheds, so it’s not just  
192 one river that we’re working with in the community, it’s an entire bayou and drainage  
193 system that’s pretty complex. Just because [...] your infrastructure is outside that flood  
194 zone doesn’t necessarily mean you’re not susceptible to flooding” - *Agency 3*

195

196 Similarly, there was no consensus on whether each Harris County hospital was aware of  
197 their flood risk. Agency 3 was under the impression not many hospitals were likely aware of  
198 their vulnerability, whereas Agencies 1 and 2 felt confident hospital emergency managers were  
199 aware of their hospital’s location inside or outside FEMA flood hazard areas. However, all  
200 agencies interviewed expressed concern this awareness could change in the future, since FEMA  
201 continually updates flood hazard areas, such that hospitals might find themselves located within  
202 a flood hazard area when they were not previously.

203

## 204 **Hospital Emergency Response Successes during Hurricane Harvey**

### 205 *A) Infrastructure Improvements*

206 Despite many hospitals reporting being surrounded by water during Hurricane Harvey,  
207 with flooded roads impeding access, very few experienced serious flooding within their  
208 buildings.<sup>7,8</sup> This finding indicated the most remarkable success during Hurricane Harvey was  
209 the significant infrastructure improvements that prevented most hospitals from experiencing  
210 internal flooding similar to that resulting from Tropical Storm Allison.<sup>9</sup>

211 Following Tropical Storm Allison, many hospitals in Harris County implemented  
212 infrastructure improvements including flood gates, above ground generators, water pump

213 systems, and submarine doors.<sup>2,10</sup> The hospitals within the TMC alone invested approximately  
214 \$50 million in infrastructure improvements that, for the most part, prevented major flooding  
215 inside those hospitals during Hurricane Harvey.<sup>7,11</sup> All three hospitals surveyed provided  
216 examples of the infrastructure renovations and retrofits undertaken in the years preceding  
217 Hurricane Harvey, and although we were unable to confirm the degree to which these  
218 infrastructure improvements prevented flooding, our survey and interviews indicated the  
219 improvements played an important role.

220

#### 221 *B) Advanced Planning*

222         Two forms of advanced planning proved to be particularly successful during Hurricane  
223 Harvey. First was using the Hospital Emergency Incident Command System (HEICS), a  
224 hospital-specific version of the Incident Command System (ICS), which has long been  
225 recognized as an effective protocol for preparing hospital staff for emergencies through a pre-  
226 established hierarchical structure and task-specific positions.<sup>12</sup> During Hurricane Harvey, HEICS  
227 proved largely successful, since hospitals had proactively trained staff members, identified an  
228 emergency response personnel hierarchy, assigned responsibilities, and created emergency event  
229 procedures.<sup>9</sup>

230         Second, through years of table-top exercises, simulations, and drills, hospitals were able  
231 to successfully assess and modify emergency plans and procedures in preparation for a crisis  
232 scenario like Hurricane Harvey.<sup>13,14</sup> Hospitals were thus able to make quick decisions before  
233 Hurricane Harvey's arrival. For example, many hospitals notified patients that elective outpatient  
234 surgeries and non-essential appointments would be cancelled to conserve critical supplies and  
235 dedicate staff members to continuing inpatient care, such as chemotherapy and dialysis.<sup>5,15</sup>

236 Similarly, in the days prior to Hurricane Harvey, hospitals began augmenting critical supplies  
237 stockpiles including linens, medications, food, and water.<sup>9</sup>

238

### 239 *C) Hospital Staff Dedication*

240 The third emergency response success during Hurricane Harvey was the dedication  
241 demonstrated by the hospital staff. In preparation for Hurricane Harvey, hospitals formed ride-  
242 out and recovery teams composed of physicians, nurses, doctors, and technicians.<sup>14</sup> The ride-out  
243 teams arrived before the hurricane and remained on-site throughout the hurricane, while recovery  
244 teams arrived afterward to relieve the ride-out teams.<sup>9</sup> Individuals in ride-out teams worked 12-  
245 hour shifts and slept in makeshift quarters within the hospital.<sup>5,11</sup>

246

247 “From the very beginning, all staff are told they are essential. We have three times the  
248 number of people required to run the hospital listed as willing and personally prepared to  
249 show up and support the hospital in an emergency. The culture is greatly supportive of  
250 this and one of our greatest strengths.” - *Hospital C*

251

252 In many cases, roadway flooding meant ride-out teams remained on-site longer than  
253 anticipated. Reports also indicated some dedicated staff walked through deep water or kayaked  
254 to reach their hospitals.<sup>16</sup> Individuals in ride-out teams additionally found themselves filling roles  
255 outside their job descriptions to meet the needs of the patients in their care.<sup>17</sup> In an extreme case,  
256 doctors at Lyndon B. Johnson Hospital were required to perform brain surgery—the first in the  
257 hospital’s history—because they could not safely transfer the patient to a hospital that regularly  
258 performed brain surgery.<sup>18</sup>

259

260 *D) Collaboration*

261           The fourth emergency response success during Hurricane Harvey, which emerged during  
262 interviews with local agencies, was the importance of pre-established partnerships and  
263 collaboration. During a disaster, knowing the contacts for partner organizations and maintaining  
264 routine communication is essential for quick response.

265

266           “In terms of collaboration, I think we do a really good job. We don’t do a good job of  
267 publicly outlining the collaboration. So most people think we’re in two different silos,  
268 which is not the case.” - *Agency 2*

269

270           Despite the agreement among survey and interview respondents regarding the importance  
271 of collaboration between hospitals and partner organizations, each of the four local agencies  
272 interviewed expressed that staffing needs, time constraints, and costs were large barriers to  
273 collaborating more with hospitals. Two agencies noted in an ideal world they would have a  
274 larger planning team, with at least one individual dedicated to interfacing with other partner  
275 organizations and hospitals.

276

277           “There is coordination; however, the larger hospitals and more urban geographic areas  
278 experience a greater sophistication in their preparedness collaboration. There are areas of  
279 the state where coordination exists, yet immediate access to resources can be delayed  
280 either because of distance or fewer personnel. The goal of federal agencies, state and  
281 local governments, and hospitals is to facilitate as much coordination as possible.”

282 - *Agency 4*

283

284 The surveys, interviews, and secondary source analysis all echoed that SETRAC is an  
285 important asset to the Harris County healthcare system. SETRAC connects local hospitals and  
286 partner organizations and provides assistance in communication, cooperation, and collaboration,  
287 and supports the Catastrophic Medical Operations Center (CMOC), which is responsible for  
288 coordinating hospital closures, patient transport, and medical resource requests during  
289 emergency events.<sup>19,20</sup>

290

291 “I think you’ll be hard-pressed to find any other hospital preparedness program or  
292 regional system that’s better prepared than here. I think we probably have one of the most  
293 advanced Catastrophic Medical Operations Center (CMOC) that we know works and has  
294 demonstrated it works in the past. And they continue to improve.” - *Agency 3*

295

296 Overall, the hospital surveys and interviews with local agencies revealed robust  
297 partnerships and a high level of collaboration in Harris County, as well as a sense of pride in  
298 their collective response to Hurricane Harvey.

299

### 300 **Hospital Emergency Response Challenges during Hurricane Harvey**

#### 301 *A) Mobility and Access*

302 The combination of hospital surveys, interviews with local agencies, and secondary  
303 sources conveyed the most salient challenges hospitals faced during Hurricane Harvey were  
304 access issues, as many major roadways were underwater for extended periods of time, with

305 floodwaters surrounding some hospitals in Harris County.<sup>2,7</sup> Roadway flooding largely prevented  
306 using traditional transportation methods like cars and ambulances to deliver staff and individuals  
307 in need of care to the area’s hospitals, thus necessitating alternative transportation methods, such  
308 as airboats and helicopters. Additionally, critical hospital supply shipments were often unable to  
309 be delivered, causing food and medication shortages.<sup>15,21</sup>

310

311 “Mobility and access. Mobility relative to getting supplies in and out. Access for people  
312 who needed to get to those hospitals, because there were a number of areas particularly  
313 along the major highways where people couldn’t travel around the city.” - *Agency 2*

314

315 In response to these widespread hospital mobility and access issues, Agency 2 also commented  
316 conversations between Harris County and the Texas Department of Transportation (TxDOT) are  
317 already underway, to strengthen partnerships and improve transportation resilience for the  
318 healthcare sector during future flooding events.

319

#### 320 *B) Planning*

321 Hurricane Harvey was not only a historic rainfall event lasting over a week, but its  
322 strength was largely unexpected.<sup>22</sup> SETRAC reported that Harris County hospitals would have  
323 made preparations for the storm much earlier if they knew Hurricane Harvey would make a  
324 relatively direct landfall as a Category 4 hurricane.<sup>23</sup> Even with procedures in place, hospitals  
325 had very little warning of the impending hurricane and flooding, hastening decisions on  
326 evacuating patients or sheltering in place. Overall, very few at-risk hospitals evacuated all  
327 patients before the flooding.<sup>2,24</sup> Because there is a high risk level involved in moving injured and

328 ill patients, only patients in the most critical conditions were considered for evacuation during  
329 Hurricane Harvey. Additionally, transporting patients during a hurricane is difficult since each  
330 patient needs to be individually matched with a hospital both far from the hurricane's path and  
331 able to take in patients.<sup>23,25,26</sup>

332 Another unplanned situation arose from lack of communication with first responders,  
333 who were responsible for delivering individuals to safety who were evacuated from their homes  
334 or high water. Roadway flooding often meant people were dropped off at the nearest hospital,  
335 rather than the nearest shelter, even when no medical attention was needed.<sup>21,27</sup>

336

337 “There were so many areas that were inundated and people being evacuated or rescued  
338 from their homes, and the easiest option for a lot of first responders is to bring them to  
339 hospitals. We even saw that in helicopter evacuations and they were just overwhelming  
340 the TMC with the evacuations of people rescued from homes and being dropped off at a  
341 hospital.” - *Agency 3*

342

343 Similarly, hospitals had issues maintaining their phone lines due to calls from individuals  
344 trapped at home with health issues, and other hospitals trying to evacuate their patients.<sup>26,28</sup>

345 Lastly, hospitals were overwhelmed by requests from the general public to fill prescriptions  
346 because many retail pharmacies were either inaccessible due to flooding or had trouble  
347 maintaining sufficient medication stock.<sup>9</sup> Despite advanced planning, this influx of individuals,  
348 calls, and requests overwhelmed the available resources at receiving hospitals.<sup>21</sup>

349

350 *C) Staffing*

351           Although hospital staff demonstrated remarkable dedication, as detailed above, many  
352 hospitals still struggled with staffing concerns during Hurricane Harvey, echoed in all three  
353 hospitals' surveys. Most notably, staff were often unable to get to work due to the extended  
354 flooding, or they were unavailable on short notice when some hospitals delayed declaring a ride-  
355 out — both contributing to understaffed ride-out teams.<sup>17</sup> Hospital A also indicated preparedness  
356 concerns related to a lack of situational awareness within the Hospital Emergency Incident  
357 Command System (HEICS) structure.

358

359           “[The] decision to declare ride-out was made too late, which meant critical personnel  
360 were not available and could not reach the hospital in time; lack of situational awareness  
361 within Incident Command structure meant proper incident management did not occur;  
362 logistical resources were strained; overall preparedness was missing.” - *Hospital A*

363

364           Additionally, with many staff remaining on site to complete 12-hour shifts, or unable to  
365 leave due to flooded roads, hospitals were forced to create makeshift quarters separate from the  
366 patients to provide staff sleeping space.<sup>29,30</sup> Many hospital staff members in ride-out teams  
367 experienced anxiety and burnout, and could have benefited from support services developed  
368 specifically for hospital staff and their families.<sup>14,21</sup> As Agency 1 stated in an interview, it is  
369 important to remember hospital staff are also undergoing a personal disaster during these  
370 emergency events.

371

372   **Barriers to Hospital Flood Preparedness Efforts in Harris County**

373           Some hospitals and local agencies in Harris County responded they had few barriers to  
374 hospital emergency management efforts from their repeated experience with extreme flooding  
375 events. As one hospital emergency manager stated:

376

377           “I don't believe we have barriers—because of past problems, the organization is now  
378 fully committed to disaster preparedness” - *Hospital A*

379

380           Neither political resistance nor uncertainty about future flooding were considered barriers  
381 to emergency management, according to most survey and interview participants, since well-  
382 informed regulatory agencies provided guidance on best practices and flood risk.

383           However, financial issues and staffing were mentioned in other survey responses and  
384 interviews as the biggest barriers preventing preparedness and mitigation efforts in hospitals.  
385 Agencies 1 and 2 explained both for-profit and not-for-profit hospitals are responsible for  
386 balancing the need for stronger flood emergency management efforts and the associated costs of  
387 implementing those efforts and hiring the necessary staff.

388           Two unpredicted barriers to flood mitigation efforts, both involving local utilities, were  
389 identified through the interviews with local agencies. First, many hospital facilities in Harris  
390 County, and within the TMC in particular, are fully integrated into the City of Houston's utility  
391 services, which include water and sewage. Since these utilities can fail during extreme flooding  
392 events, the TMC's hospitals would ideally prefer an independent system, requiring a massive  
393 capital infrastructure project. Another barrier to flood mitigation efforts stems from Harris  
394 County's power lines, which are strung above-ground on poles and are often damaged during  
395 high wind events, creating extensive power outages. However, unlike many other Texas cities,

396 there has been hesitancy to bury the power lines underground because Harris County in  
397 particular is susceptible to flooding and subsidence, which also pose a threat to power lines.  
398 These two utilities-related challenges to flood mitigation were echoed by the U.S. Department of  
399 Homeland Security's 2018 National Preparedness Report, which identified infrastructure  
400 interdependencies as a top challenge to disaster response and recovery across the country.<sup>31</sup>

401

## 402 **DISCUSSION**

403         The analysis of surveys, interviews, and secondary sources revealed Harris County  
404 hospitals learned their most valuable lessons about flood preparedness and mitigation through  
405 their direct and repeated experience with flooding over the years. These lessons led to improved  
406 preparedness and the implementation of several sophisticated flood mitigation projects across  
407 Harris County prior to Hurricane Harvey. The most remarkable hospital emergency response  
408 successes were the infrastructure improvements in many hospitals that prevented devastation  
409 similar to that from Tropical Storm Allison. Additional successes included hospital staff  
410 dedication and resilience, advanced planning and preparation aided by using emergency  
411 exercises and the HEICS structure, and pre-established collaboration with local partner  
412 organizations (SETRAC, in particular) and government agencies at multiple levels.

413         Despite these successes, hospitals still experienced challenges, such as staff burnout and  
414 prolonged roadway flooding that restricted the transportation of supplies, patients, and staff to  
415 hospitals. Overall, Hurricane Harvey's path and strength was unanticipated, leading to a  
416 breakdown of advanced planning, particularly related to evacuating and transporting patients out  
417 of the area while simultaneously managing an influx of patients, phone calls, and requests. These  
418 results are consistent with the findings of several reports written after Hurricane Harvey.<sup>19-21</sup>

419           The current state of flood preparedness and mitigation in Harris County hospitals is rather  
420 advanced and mature, validated by the tangible sense of pride in the collective preparation and  
421 response to Hurricane Harvey. However, in light of the remaining challenges, Harris County  
422 could take additional steps to bolster emergency management efforts in hospitals with fewer  
423 financial and staffing resources and less direct flood experience, and could address the county-  
424 wide utilities challenges described above. In the year following Hurricane Harvey, Harris County  
425 hospitals have already started preparing for the next big hurricane by updating policies, creating  
426 an inter-institutional information portal, seeking funding to improve transportation resilience,  
427 and purchasing high-water vehicles.<sup>32</sup>

428

#### 429 **Limitations and Future Work**

430           This case study had a few limitations worth noting. First, this study focused specifically  
431 on Hurricane Harvey’s impacts on hospitals in Harris County, meaning the results may not be  
432 generalizable to other cities or other extreme weather events. However, the successes,  
433 challenges, and lessons learned presented in this case study are valuable and have potential to  
434 motivate other cities’ hospitals to engage in extreme weather emergency preparedness and  
435 mitigation, perhaps without previously experiencing an extreme weather event of their own.  
436 Second, the survey responses were limited in number and reach. The hospitals that responded to  
437 the survey are all large, urban hospitals with substantial financial and staff resources at their  
438 disposal for flood preparedness and mitigation efforts, which is not necessarily representative of  
439 the average hospital in Harris County, or other locations across the U.S. To supplement the  
440 survey and semi-structured interviews with additional county-wide perspectives, we also  
441 synthesized news reports and other relevant documents, but it is important to note that secondary

442 sources may have lower reliability or accuracy than primary sources. Third, this study had a  
443 singular focus on hospitals, rather than the healthcare system as a whole, which could have  
444 included walk-in emergency rooms, primary care, nursing homes, dialysis centers, pharmacies,  
445 and emergency medical services. Lastly, hospital emergency managers and local agencies may  
446 have a tendency to highlight successes rather than challenges, potentially biasing findings.

447 Future work should consider implementing a standardized approach to evaluating  
448 hospital emergency preparedness, mitigation, and response to extreme weather events to allow  
449 comparisons and sharing of lessons learned across regions.

450

## 451 **CONCLUSIONS**

452 This case study aimed to contribute to efforts aimed at improving critical healthcare  
453 infrastructure to better prepare for, respond to, and recover from future catastrophic flooding  
454 events like Hurricane Harvey. Although this case study focuses on the evaluation of Harris  
455 County's healthcare system response to one specific extreme weather event, the methodologies  
456 employed could be easily reproduced in other cities and for other events. With extreme flooding  
457 predicted to become more frequent and intense in various regions across the U.S. over the next  
458 decade,<sup>3,33,34</sup> it is now more important than ever to focus specifically on flooding's impacts on  
459 healthcare infrastructure.
