Abstract:
Enthusiasm around mobile technology, particularly iPads, and its applicability to student learning that has flourished on the Ohio State University campus. During the 2013–2014 academic year, the Ohio State University Libraries sought to understand and participate in campus-wide initiatives on student engagement and emerging technology by launching the BuckiPad Pilot Program, which offered students the opportunity to check out an iPad from the library. What is most fascinating about the BuckiPad Pilot Program as a case study is that, in spite of a campus atmosphere ripe for iPad adoption, the circulation and assessment data of the pilot did not reveal long-term, cost-effective sustainability.

Introduction:
Enthusiasm around mobile technology and its applicability for student learning and engagement has flourished on the Ohio State University (OSU) campus. In the spring of 2012, OSU launched the Digital First initiative, aimed at transforming classroom and learning experiences for a student population of over 57,000 through use of innovative technologies. The Office of Distance Education and eLearning at OSU wrote that Digital First has, “worked with the Ohio State community to develop and deliver mobile solution for anytime, any-place
learning. These include free content from iTunes U, low-cost digital textbooks, assistance with iPad deployment” (Ohio State University, n.d).

A fascination with iPads in transforming the college experience is particularly pronounced at OSU. An active community of over ninety faculty and staff are engaged in sharing best practices on using iPads in the classroom. The OSU marching band has garnered tremendous press coverage for a student-led initiative to use iPads to design, practice, and perform phenomenal halftime routines, culminating with an appearance in an iPad Air commercial. OSU assistant professor, Nicole Kraft, from the School of Communications, has been featured in a Washington Post article based on her unique approach to taking attendance via Twitter, a practice enabled due to the deployment of iPads to all students in her journalism class (McFarland, 2014). In order to verify that students are actually in attendance, Kraft requires the tweets be relevant to the class content that day and contribute to the ongoing class discussions. Finally, the alternative student-focused paper, UWeekly, has referred to OSU as “iPad University” in an article about the various iPad initiatives on campus (Briggs, 2013).

The Ohio State University Libraries has sought to understand and participate in the campus-wide initiatives on mobile technology and student learning. Over the course of the 2013-2014 academic year, the Libraries launched the BuckiPad Pilot Program to provide OSU students, faculty, and staff the opportunity to checkout an iPad from the OSU Thompson Library.

What is most fascinating about the BuckiPad Pilot Program, as a case study, is that, in spite of a campus atmosphere ripe for iPad adoption, the circulation and assessment data of the pilot program did not reveal long-term, cost-effective sustainability.

**Literature Review:**
In July 2012, Apple CEO, Tim Cook, stated that, “The adoption rate of iPads in education is something I’d never seen from any technology product in history” (Booker, 2013, para. 5). Higher education has participated in the rise of iPad adoption on campuses across the United States, not only from students and faculty as individual consumers, but also at the institutional level through program, department or institution-wide deployment. In fall 2010, Seton Hill University, a small private liberal arts college in Pennsylvania began distributing iPads to all full-time students, about 2,100 at the time (Laster, 2010). Lynn University in Boca Raton, Florida began loaning iPad minis pre-loaded with e-textbooks for core curriculum to all incoming freshman in fall of 2013, and has expanded the program to all daytime undergraduates and new MBA students (Lynn University, 2013). Institution-wide initiatives like these and the press coverage they generate contribute to a growing interest in using iPads in higher education as a way to transform the learning experience.

iPads in higher education have not come without controversy or backlash. When Stanford University’s School of Medicine loaned iPads to all new students, they found that only a few weeks into the term about half the students had already abandoned their iPad (Fischman, 2011). Back at Ohio State University, through a partnership with the Digital First Initiative, the Ohio State Athletic Department has given its estimated 1,100 student-athletes an iPad as a way to enhance tutoring and mentoring services, as well as access athletic department and team content. Some students at OSU expressed concern over the program, suggesting that funds could be better used elsewhere (Periatt and Brennan, 2013).

Academic libraries have also participated in the adoption of iPads in higher education through the development and deployment of iPad lending programs. University libraries across the country, from Haveford to CalTech, the University of South Florida to Boston College,
Princeton to the University of Arizona, to name a few, have all developed programs that enable some portion of their patron population to borrow an iPad from the library (Swanson, 2013).

Much of the research on iPad loan programs and academic libraries has focused on student use of iPads for academic purposes. At the University of Illinois, iPads were loaned to first-year students for one-week and their user behavior was explored through follow-up surveys and focus groups (Hanh and Bussell, 2012). Findings from this research include student emphasis on the importance of wireless connectivity in the classroom and the convenience and portability of using an iPad during class (Hanh and Bussell, 2012). At Ryerson University, the library conducted research on long-term use of iPads among students through a project that followed four students who were given an iPad as part of the research for an academic year (Eichenlaub, N., et. al., 2011). As Eichenlaub et al., found (2011), “the iPad is a hybrid device that can be used not only to consume information, but also to produce more content” (p. 20).

What is common among academic libraries and universities is the student-focused outlook on iPads in higher education. From research to initiatives, iPads are seen as a way to transform the educational experience for students, through improving access to information, enhancing student engagement, or offering alternative models for textbooks and course content at a reduced cost.

**Overview of the BuckiPad Program**

The Ohio State University Libraries created the BuckiPad Pilot Program through an Innovation Fund grant. This grant enables librarians and staff within the OSU Libraries to develop innovative ideas and services that have the potential to produce high value for library patrons.
The BuckiPad Pilot was designed to allow students, faculty, and staff flexibility in how they are able to use the iPads, while also providing them with a device that features OSU and library-curated content. Some of the features and restrictions of the program include:

- 24 hour load periods (updated from five hours halfway through the first semester of the pilot due to user feedback).
- Ability to use iPads outside of the library.
- Only one iPad per patron per checkout (meaning patrons are unable to check out multiple iPads at a time for classroom or group use.)
- No holds allowed on devices.
- Pre-loaded with content and apps such as those that provided access to library resources, apps unique to the OSU community, or apps recommended for purchase by users.
- Choice between borrowing an iPad 2 or an iPad mini.
- Loan includes a charger.

The BuckiPad pilot program ran from the beginning of fall semester 2013 through the end of spring semester 2014, with iPads available for checkout from the Thompson Library at the OSU, Columbus campus. Ten iPad 2s and ten iPad minis were purchased for the pilot. The development and deployment of the pilot involved collaboration among various library departments, notably Acquisitions, Circulation, and IT.

Marketing efforts for the BuckiPad pilot program included:

- Campus press coverage in the alternative weekly paper, UWeekly, the OSU student news program, Buckeye News Now, and the Digital First newsletter;
- Library developed promotions on the OSU Libraries’ homepage, digital monitors found throughout Thompson Library, and leaflets distributed at other Columbus campus branch libraries;
- A poster presentation aimed at faculty during the OSU Innovate Conference
- Publicity via various social media outlets, such as Twitter, from the OSU Libraries, librarians, campus partners, and patrons.
Though reaching all 57,000 students on the Columbus campus is unrealistic, the
marketing strategy aimed to target patrons more likely to borrow an iPad. For example, the
digital monitors in Thompson Library targeted students who were already users of the library and
who could more easily stop by the circulation desk to checkout an iPad. In addition, faculty and
staff engaged in innovative teaching using iPads and other learning technology were targeted in
order to encourage them to promote the BuckiPad program to their students so that learning
technology gains could continue outside the classroom.

**Assessment**

While other measures of assessment were collected during the pilot program, such user
surveys, what ultimately mattered as a measure of success were the circulation statistics and
calculations of cost per use.

**Circulation Statistics**

From August 21, 2013 through May 14, 2014, the iPads and iPad minis were loaned
1,444 times from the Thompson Library. On average, the iPads and iPad minis circulated a total
of 41 times per week. Though this number may sound reasonable, if availability is maximized
and every device is checked out once a day, seven days a week, then the iPads would have
circulated a total of 140 times per week. Thus, when considering an average circulation per week
of 41 loans against the maximum allowable loans per week, this number only represents 29% of
the total available checkouts per week. In other words, on average, 71% of the iPads and iPad
minis sat idle and unused during the pilot.

For the iPad minis specifically, which were purchased for their smaller size, greater
portability, and lower price point, circulation was noticeably lower. On average, the iPad minis
circulated only 11 times per week, which translates to 85% of the minis sitting idle or unused during the pilot.

Graph 1. Circulation statistics per week during the BuckiPad pilot. This graph shows the total number of checkouts per week for the iPad mini, iPad 2, and cumulative total during the pilot program.

If lending rates had been between 60-90% of the allowable loans (or between 84-126 loans per week), then the program would have been seen as successful. A rate higher than 90% would have indicated a need to reevaluate the number of iPads available in the pilot program. Instead, the pilot saw a circulation rate of 29%, which is less than half of the lowest benchmark for success. Simply put, the iPads are not being checked out at a reasonable rate and this is problematic for a program designed specifically to loan iPads.

**Cost per use**

Through a grant, the OSU Libraries invested $11,099 into the BuckiPad pilot program. This funding supported the purchase of 10 iPads and 10 iPad minis, a Bedford power cart to charge and store the iPads, Otterbox cases for hardware protection, a Mac mini to manage the configuration and deployment software, lightening adapters, and purchase of apps pre-loaded
onto the iPads. These figures do not take into account the labor and overhead costs of the program.

The total cost per use during the pilot program was $7.69 per loan, based on the 1,444 total loans. Circulation statistics were collected over a period of 31 weeks. If each iPad circulated once a day, seven days a week, for all 31 weeks, then the total number of loans during the pilot would have been 4,340. Based on this estimate, the lowest possible cost per use would have been $2.56 per loan. If the program were to continue at the same level of use, with no additional investment, then by the second year, total cost per use over the program lifetime would have reached a more reasonable amount of $3.84 per loan, and in three years cost per use would have reached $2.56.

Discussion

When planning the BuckiPad lending program it was not anticipated that the pilot would face a problem of low circulation. In the 2013-2014 academic year, the OSU Libraries served a student population of 57,466 undergraduates and graduate students on the Columbus campus. In
addition, for calendar year 2013, Thompson Library saw 2.26 million gate counts (Diedrichs, 2014). It was assumed that because of the sheer number of students on campus and volume at which the Thompson Library is used, the BuckiPad program would see high circulation rates and thus success.

If the pilot were to continue an additional 2-3 years, cost per use could have reached reasonable amount of $2.84-$4.26 per checkout. With low usage and high cost per use, additional investment into the BuckiPad program in order to create a sustainable service, is not advisable. However, the issue with the BuckiPad pilot is not only the cost. The issue is the underutilization of the iPad lending service in comparison to both the number of iPads available and the student population served. The major question that came out of this pilot is, why was circulation of the iPads so low?

With a campus culture embracing emerging technology trends like iPads, and a marketing plan that was thoughtfully crafted to target potential users, neither are obvious reasons for low circulation rates. So then, what other reasons could be driving low circulation rates of the iPads? Perhaps there is something else about the iPad and its brand that impacts circulation and use.

The iPad, originally designed as a personal, consumer device, has not been branded as something to be shared. Because of this, perhaps the iPads is not an item conducive to a traditional lending in a library. Some of the research on iPad lending begins to address this notion. Hahn and Bussell (2012), write that, “configurability to individual needs was another key trend from results surrounding mobile apps. Students wanted the library to have apps relating to major fields of study that directly meet their assignment-level needs and can connect them with specific, useful, current course information” (p.46). In their article on iPad lending programs
within health sciences libraries, Gillum and Chiplock (2014) write that, “lines are blurred between personal and educational use of the iPad, as it is so efficient at both” (p. 37), and further suggest that librarians and faculty need to emphasize the academic value of the iPad in order to distinguish the iPad as a tool for student’s educational use. What both of these findings suggest is that iPad lending in academic libraries may benefit by developing programs that embrace this hybrid notion of an iPad—a sharable device that is best suited for individual configurability, as well as one that serves both educational and personal needs.

Longer loan periods may be one way of developing an iPad lending program that embraces its value as both an educational and personal device. As Hahn and Bussell (2012) found, “we...thought that one week would be sufficient time with an iPad, but as we talked with the students we recognized that they might need longer checkout times to truly experiment with the iPad and take advantage of all its features” (p. 46). At Ryerson University, a research project studied student’s use of library provided iPads during the course of a full academic year (Eichenlaub, et al., 2011). When participants in this research project were asked about the idea of a shorter-term device loans, though they were supportive, they expressed concern “due to the personalized nature of this device (email, course- ware, scheduling, music, and photos)...[and] also expressed concerns that it would be difficult to start anew with each loan” (Eichenlaub, et al., 2011 p. 20).

The question, however, is what is an ideal loan period? Would it be a full term or a full academic year? Furthermore, should it be the responsibility of the library to loan devices for longer periods of time, or is this an initiative better suited for another department on campus? For example, at OSU, should the Libraries consider term-long iPad loans, or should iPads be
loaned at the departmental level, for students enrolled in courses where iPad use in the classroom is already occurring?

**Conclusion**

Though the BuckiPad Pilot Program did not pan out as a long-term, sustainable service for OSU Libraries, the pilot’s shortcomings provided invaluable insight and perspective. The low number of loans during the pilot program challenged assumptions and preconceived ideas about students and technology trends. At a university the size of OSU, it is no longer a valid assumption that the adage “if you build it, they will come,” can apply to any student-focused project. The sheer number of students and existing high usage of the Thompson Library does not necessarily translate into high use of all services and programs offered by the Libraries, such as the BuckiPad program. Instead, intimate knowledge of students, their needs, expectations, and perceptions of library services and of technology is necessary for program development.

In addition, the idea of an iPad and its value to a user is more complex than the notion of an iPad as another technology tool. Whether it stems from branding by Apple or through how iPads have been adopted by consumers, the iPad is a personal device and cannot be easily divorced from this image. For libraries considering iPad lending programs, it is essential to understand this concept.

Existing research and the findings from this article suggest that students’ relationship with iPads and technology in higher education is much more complex than how it is portrayed in the media. Further research is needed on why students adopt or reject technology, in addition to the existing research on what they use and how they use it. Further research in this area could provide a deeper understanding of the role of iPads and other emerging technologies in higher
education, and provide guidance to both libraries and institutions in designing and investing in new technology initiatives.
